TITIE: Dependence of daily solar variations in the magnetic field on solar wave radiation CITED SOURCE: Tr. Sibirsk. fiz.-tekhn. in-ta pri Tomskom un-te, vyp. 45, 1964, 185-190 TOPIC TAGS: astronomic data, solar magnetic field, solar radiation effect, SOLAR CYCLE 12,55 TRANSIAMION: A study was made of the dependence of the amplitude of quiet daily solar variations in a magnetic field on solar wave energy. Equations were derived for the regression between the solar constant, expressed in equatorial hours, and the S<sub>q</sub>-variations amplitude for middle latitude stations in the Soviet Union. The fluctuation in the S<sub>q</sub>-variations amplitude during the year is in linear dependence (for middle latitude stations) on the volume of solar wave radiation. The cyclic variability of the regression equation coefficient in the solar cycle was developed on the basis of the analysis. SUB CODR: AA ENCL:

TITIE: Interrelation between the ionospheric parameters of the F2 stratum and the

quite-sun variations in Tomsk the magnetic field

SOURCE: Ref. zh. Geofizika, Abs. 54192

REF SOURCE: Tr. Sibirsk. fiz.-tekhn. in-ta pri Tomskom un-te, vyp. 45, 1964,

88-92

TOPIC TAGS: ionosphere, geomagnetic field, solar energy

TRANSIATION: On the basis of an established relationship between ionospheric parameters and variations in elements of a geomagnetic field under the effect of solar energy entering the atmosphere, regression equations are given for the interrelationship between ionospheric parameters and  $S_{\rm q}$  variations in a magnetic field. It is shown that the regression equations define the relationship between the observed

values of ionospheric parameters and the  $S_{\mathbf{Q}}$  variations.

TITLE:

On Some Peculiarities of the Combustion in an Engine Having a Combustion Chamber in the Piston (O nekotorykh osobennostyakh protsessa sgoraniya v dvigatele s kameroy v porshne)

PERIODICAL: Tr. Leningr. korablestroit. in-ta, 1954, Nr 14, pp 153-170

ABSTRACT: An experimental investigation of combustion chambers carved into the top of the piston of a slot-controlled uniflow two-stroke engine is outlined in the paper. The investigation was conducted on a one-cylinder engine (bore 65 mm, stroke 90 and 120 mm) with tapered-skirt pistons and with various alternate designs of the combustion chamber. The latter were formed in the shape of a spherical segment. According to the data obtained from the investigation, the use of the chambers in the pistons increases the power by 15-20% and simultaneously lowers the fuel consumption by 7-10%.

On the Automatic Switch-Off of the Turbine from the Steam Duct if Water is Spattered Into it (Avtomaticheskoye otklyucheniye turbiny ot paroprovoda pri zabrose v nego

vody)

PERIODICAL:

Energetik, 1958, Nr 2, p 10 (USSR)

ABSTRACT:

If water is spattered into the turbine, the steam-pass section of the turbine gets damaged. A new automatic device aimed at preventing this, has been installed at the mobile power station Nr 45. The new automatic device works on the basis of the electroconductivity of the boiler water. The possibility of spurious operation of the new system is eliminated by means of a screen-cover installed above the contacts' plug. The

TITLE:

The dynamics of self-adjusting systems with rapidly

varying parameters

PERIODICAL: Akademiya nauk SSSR. Izvestiya. Otdeleniye tekhnicheskikh

nauk. Energetika i avtomatika, no.3, 1962, 122-131

The usual quality criteria of self-adjusting systems take TEXT: an appreciable time to calculate and can therefore be used only for systems with slowly varying parameters, i.e. parameters which practically do not change during the time for calculation of the The author considers here systems of the type quality criterion.

 $\varphi(\lambda)(\lambda^3 + A_1\lambda^2 + A_2\lambda + A_3) = 0$ (1)

where the nearest roots to the imaginary axis are a pair of The real root is sufficiently far from the axis so that the free motion of the system is determined by the complex pair. The system can be approximated by a third order system with variable coefficients Ai. The mode of operation considered is one with the system close to the boundary of stability. Here Card 1/3

S/024/62/000/003/003/011 E140/E463

The dynamics of self-adjusting ...

Eq.(1) takes the form

$$(\lambda + \alpha)(\lambda^2 + \beta^2) = 0 (2)$$

with

$$\alpha = A_1$$
,  $\beta = \sqrt{A_2}$ 

The self-adjusting system alters the values of the Ai if the system leaves the boundary of stability. Eq.(1) is expanded in a Taylor series about any one root in powers of that root and only the linear term is retained, yielding an expression

$$\delta_{\dot{\mathbf{i}}} = \lambda_{\dot{\mathbf{i}}} - \lambda_{\dot{\mathbf{i}}}^{\circ} = \frac{F(\lambda_{\dot{\mathbf{i}}}^{\circ})}{\frac{\partial F(\lambda)}{\partial \lambda} |_{\lambda = \lambda_{\dot{\mathbf{i}}}^{\circ}}}$$
(3)

where F is the characteristic equation of the system. This permits expressions to be found describing the effects on the stability of varying any given  $A_i$ . The quality criterion employed is based on the ratio of peak amplitudes over a period of oscillation. Necessary and sufficient conditions are determined Card 2/3

The method of the auxiliary operator is applied to the determination of the components of the system gradient in an adaptive control system. The method is claimed to be superior to that of G.W. Anderson et al (IRE National Convention Record, pt.4, 1958) in the speed of response and absence of test signals perturbing the process. The disadvantages of the system are 1) it places the control system on the oscillatory boundary of stability, which is inadmissible for certain processes, 2) it is necessary to determine the component corresponding to the two roots nearest the imaginary axis and 3) it is only possible to adjust a single parameter. See also the paper on adaptive systems with gradient search (same journal and issue, pp.113-120). There are 5 figures.

TITLE: Investigation of a regenerative optron with optical feedback

SOURCE: AN SSSR. Doklady, v. 168, no. 2, 1966, 310-313

TOPIC TAGS: light emission, photoresistor, trigger circuit

ABSTRACT: Conditions under which an opto-electronic cell with positive optical feedback provides a bistable volt-ampere. characteristic are analytically investigated. An experimental optron was constructed using a GaP-photodiode and a CdS photoresistor. The components were well matched by spectrum and were operated in the vicinity of  $\lambda_{\text{max}} = 0.6\mu$ . Optical coupling between the photodiode and the photoresistor was by direct illumination, without the use of fiber optics. The experimental volt-ampere characteristic of the device had a clearly expressed trigger-type character. Orig. art. has: 4 figures and 14 formulas.

TITLE:

Determination of the Shape of the Pulses From a Generator Based on a Secondary Emission Tube

PERIODICAL: Izvestiya vysshikh uchobnykh zavedeniy, Radiotekhnika, 1960, Vol. 3, No. 5, pp. 491-496

TEXT: Pulse-generators based on secondary emission tubes are of considerable importance and the theoretical calculation of the shape of the pulses produced by these devices is of interest. A simplified diagram of a pulse-generator of this type is shown in Fig. 1. For the purpose of analysis it is assumed that the parasitic capacitance between the grid and the cathode can be neglected, while the grid-dynode interelectrode capacitance can be added to the coupling capacitance C. The equations for the system can therefore be written as:

Card 1/10

the instant  $t_1$  the dynode current is solely dependent on the grid voltage, i.e.  $I_d = SU_g$  (see Figs. 2). From the instant  $t_1$  at which  $U_d = U_d$  until the instant  $t_2$  it can

Determination of ....

S/142/60/003/005/007/015 E192/E382

be assumed that the dynode current is dependent on the dynode voltage and follows:

$$I_{d} = S_{1} (U_{dn} - U_{d})$$
 (2)

where  $U_{\mathrm{dm}}$  is the value of the dynode voltage at which the dynode current changes its sign and

$$S_{1} = \frac{SU_{d_{1}}}{U_{dm} - U_{d_{1}}}$$
 (3)

The dependence of the dynode current on the dynode voltage can be approximately represented as shown in Fig. 2. Eqs. (1) can be written as a single differential equation and for the interval from t=0 to  $t=t_1$  the equation is

Card 5/10

Determination of ....

$$\frac{d^{2} U_{d}}{dt^{2}} + \left(\frac{1}{R_{g}C_{d}} + \frac{1}{R_{d}C_{d}} + \frac{1}{R_{g}C} - \frac{S}{C_{d}}\right) \frac{dU_{g}}{dt} + \frac{1}{R_{d}C_{d}R_{g}C} U_{g} = 0. \tag{4}$$

By introducing the notation of

$$\tau_{11} = R_d C_d; \ \tau_{20} = R_d C; \ \tau_{21} = R_d C_d; \ v = \frac{S}{C_d}$$
 (5)

Eq. (4) can be written as:

$$\frac{dU_d}{dt^3} + \left(\frac{1}{\tau_{11}} + \frac{1}{\tau_{12}} + \frac{1}{\tau_{11}} - v\right) \frac{dU_d}{dt} + \frac{1}{\tau_{11}} \tau_{12} U_d = 0. \tag{6}$$

and its solution is in the form

$$U_d = A_1 e^{\rho_1 t} + A_2 e^{\rho_2 t}, \tag{7}$$

Card 4/10

S/142/60/005/005/007/015 E192/E382

Determination of ....

where  $p_1$  and  $p_2$  are the roots of the characteristic equation and  $A_1$  and  $A_2$  are constants which can be determined from the initial conditions. From Eq. (8) it is easy to determine the self-excitation conditions for the system. The differential equation for the interval  $t_1 \leqslant t \leqslant t_2$ , where  $t_2$  is the instant when the grid voltage reaches the value  $U_{\mathbf{d}2}=U_{\mathbf{d}1}$ , is:

$$\frac{d^{1}U_{d}}{dl^{2}} + \left(\frac{1}{R_{d}C_{d}} + \frac{1}{R_{d}C} + \frac{1}{R_{d}C_{d}} + \frac{S_{1}}{C_{d}}\right)\frac{dU_{d}}{dt} + \frac{1}{R_{d}C}\left(\frac{1}{R_{a}C_{d}} + \frac{S_{1}}{C_{d}}\right)U_{d} = \frac{S_{1}U_{dm}}{R_{d}C_{d}C}. \tag{11}$$

By following the notation of Eq. (5) and:

$$s_1/c_d = 0, \qquad (12)$$

it is found that the solution of Eq. (11) is: Card 5/10

Dotermination of ....

5/142/60/003/005/007/015 E192/E382

$$\frac{d^{3}U_{d}}{dt^{1}} + \left(\frac{1}{\tau_{11}} + \frac{1}{\tau_{10}} + \frac{1}{\tau_{21}} + \nu_{1}\right) \frac{dU_{d}}{dt} + \frac{1}{\tau_{10}} \left(\frac{1}{\tau_{11}} + \nu_{1}\right) U_{d} = \frac{\nu_{1}}{\tau_{10}} U_{d_{m}}.$$
(15)

where  $p_1$  and  $p_2$  are the roots of the characteristic equation as  $\Lambda_1$  and  $\Lambda_2$  are two constants which can be determined from the initial conditions. From the instants  $t_1$ , the voltage at the Gric decreses to the value  $U_{d1} = U_{d2}$  and the voltage at the dynode increases to  $U_{d2}$ . Commencing from the instant  $t_2$ , the decrease of the voltage at the grid continues; simultaneously, the dynode/becomes dependent on the dynode and grid voltages. From the instant  $t_2$  until the instant  $t_3$ , it can be assumed that the dynode current is given by  $I_d = S_2 U_d$ , where:

Determination of ....

\$/142/60/003/005/007/015 E192/E382

$$s_2 = s_1 \frac{v_{dm} - v_{d2}}{v_{d2}}$$
 (19).

The differential equation describing the behaviour of the system from the instant  $t_2$  is similar to Eq. (4), except that S is replaced by  $S_2$ . The above formulae were used to calculate the shape of the pulses for a generator having the following parameters: S = 20 mA/V,  $U_{d1} = 20 \text{ V}$ ,  $C_{d} = 20 \text{ pF}$ ,

 $R_{d} = 2 \text{ km}$  (abstractor's note: probably  $R_{g}$ ),  $R_{d} = 200 \text{ d}$ . C = 100 pF or C = 20 pF;  $W_{do} = 1 \text{ V}$  and  $W_{do} = 0 \text{ V} \left(\frac{7}{2}\right)$ .

The shape of the pulses is illustrated in Figs. 3, where the upper figure represents the grid voltage and the lower figure shows the dynode voltage; Curves 1 are for the case of Card 7/10

+

Determination of ....

S/142/60/003/005/007/015 E192/E382

C = 20 pF; while Curves 2 are for C = 100 pF. The above analysis should be more accurate than that given in the work of G. Narud (Ref. 1 - IRE National Convention Record, 1957, No. 5, 103), where the finite value of the coupling capacitance was not taken into account.

(Abstractor's note: in many of the equations there seems to be confusion between the grid voltage  $U_{\bf d}$  and the dynode voltage  $U_{\bf d}$ .)

There are 3 figures and 1 non-Soviet reference.

TITLE: Initiation of the explosive conversion of condensed explosives by gaseous
detonation
SOURCE: Nauchno-tekhnicheskiye problemy goreniya i vzryva, no. 2, 1965, 12-21  /, 55  TOPIC TAGS: gaseous detonation, liquid explosive, tetranitromethane, benzene,
methane, oxygen, ignition delay, detonation wave, detonation velocity
ABSTRACT: Initiation of the detonation of a tetranitromethane benzene mixture (1.5:1 by volume) by detonating a stoichiometric methane oxygen mixture was studied photo-
graphically using an experimental setup consisting of a thick-wall steel pipe with a
30-mm external diameter and a 10-mm internal diameter. The steel pipe was equipped
tube was filled with the liquid (or solid) explosive. The initial gas mixture pres-
reflected wave of the gaseous detonation occurred only at the initial gaseous mixture
10 usec as the initial pressure in the gaseous mixture increased from 2 to 12 atm  Cord 1/2  UDC: 532.595.2+534.222.2

abs. At pressures of 24 atm abs., the ignition delay practically disappears, i.e., the explosive ignites instantly on contact with the gaseous detonation wave. Transition of accelerating combustion into detonation of the explosive occurred within 30 µsec after ignition. A stoichiometric tetranitromethane-benzene mixture (4:1) is even more sensitive to the gaseous detonation; it is detonated at  $p_0 > 0.66$  atm abs. even more sensitive to the gaseous detonation; it is detonated at  $p_0 > 0.66$  atm abs. even more sensitive to the gaseous detonation; it is detonated at  $p_0 > 0.66$  atm abs. even more sensitive to the gaseous detonation; it is detonated at  $p_0 > 0.66$  atm abs. with a delay time of 70 µsec. The change in the ignition delay is attributed to the difference in the surface temperature of the explosive  $T_s$ . The delay time was measured at various temperatures and the experimental data were used to calculate  $T_s$ , which vary between 712 and 841K. Spending on 7. The same values of  $T_s$  (about 800K) which vary between 712 and 841K. Spending on 7. The same values of  $T_s$  (about 800K) which takes into account thermal conductivity, specific heats, and densities of the components of the gaseous mixture and of the combustion products. At the initial gas mixture pressure below 60 atm abs., the detonation velocities in both gases (about 2300 m/sec) and in the liquid explosive (6850 m/sec) are practically independent of pressure. Orig. art. has: 5 tables, 2 figures, and 4 formulas.
